

Child Tax Credit Options for Reducing Child Poverty

States have the policy tools available to them to drastically reduce child poverty. They can build on the track record of the expanded federal credit and create Child Tax Credits that include features key to the federal expansion's success. The options presented provide the potential impacts of state Child Tax Credits on poverty and the costs of these highly promising tax credits that would reduce state child poverty rates by 25 and 50 percent.

The available options present a broad, more universal, option and a narrower, more targeted, option. The former extends higher up the income scale and is available to more middle-class families, whereas the latter is directed toward families experiencing periods of low income. The accompanying individual state pages identify details of each credit option: the maximum benefit, overall cost, number of beneficiaries, number of children lifted out of poverty, the impacts of each policy across the income distribution and the anti-poverty effects associated with credits of varying amounts.

Please note that this analysis is intended to demonstrate scenarios for best practice CTC designs and their associated costs in each state to achieve significant poverty reduction. For states where Child Tax Credits already exist, the credit levels we show are not on top of existing credits, but in place of those credits to demonstrate the benefits and costs of the proposed policy design.

# Child Tax Credit Options for 50% Reduction in Child Poverty

11,000 children lifted out of poverty

\*Benefit phase-out extends higher up the income scale and is available to more middle-class families; phase-out for joint filers after \$110,000 of income.

\*Benefit phase-out more exclusively benefits families experiencing periods of low income; phase-out begins when a family (depending on size) is no longer EITC eligible.
